

Task 10 – Simple KPI Tracking Sheet

Data Analytics Track | Business-ready KPI summary

KPI	Value
Total Revenue	■2,025,967.85
Units Sold	188
Average Order Value	■13,506.45
Top Product	Laptop
Top Product Revenue	■743,179.31

Methodology

The workbook uses an Excel Table named **tblOrders**. KPI formulas reference the table rather than fixed cell ranges, so adding new rows to the table updates the calculations automatically.

Interview Questions – Suggested Answers

1. How would you decide which KPIs matter most for a small retail business?

Start with the business objective and select a small set of measures that directly track sales, customer value and product performance. Revenue, units sold, average order value and top product provide a compact starting set.

2. How do you keep a KPI sheet accurate as new data comes in?

Use a structured Excel Table, consistent column definitions, formula-based calculations and checks for duplicates, missing values and unusual entries. Avoid fixed ranges that can exclude new records.

Dataset Note

A synthetic retail dataset of 150 orders and 20 products was created because no raw dataset was supplied with the task image.
